### Advanced R Programming - Lecture 4

Leif Jonsson

Linköping University

leif.jonsson@ericsson.com leif.r.jonsson@liu.se

September 8, 2016

### Today

Linear algebra using R

Dynamic reporting with knitr and R-markdown

ggplot2

Object orientation

# Questions since last time?

STIMA LiU

# Big Bang Theory!

Figure: Rock-paper-scissors according to Sheldon!

### sheldon\_game

```
sheldon_game <- function(player1, player2){</pre>
  alt <- c("rock", "lizard", "spock", "scissors", "paper")
  stopifnot(player1 %in% alt, player2 %in% alt)
  alt1 <- which(alt %in% player1)
  alt2 <- which (alt %in% player2)
  if(any((alt1 + c(1,3)) \% 5 == alt2)) {
        return("Player,1,wins!")
  } else {
        return("Player_2 wins!")
  return ("Draw!")
```

### Linear algebra in R

Basics in base

Uses LINPACK or LAPACK

Extra functionality : Matrix package (extra LAPACK functionality)

# Linear algebra

```
# Create matrix
A <- matrix(1:9,ncol=3)
# Block matrices
cbind(A,A)
rbind(A,A)
 Transpose
t(A)
# Addition and subtraction
A + A
# Matrix multiplication
A%*%A
```

# Linear algebra

```
Eigenvalues
eigen(A)
# Determinants
det(A)
# Matrix factorization
svd(A)
qr(A)
  Cholesky decomposition
chol(A)
```

### Donald E. Knuth, Literate Programming, 1984

Let us change our traditional attitude to the construction of programs: Instead of imagining that our main task is to instruct a computer what to do, let us concentrate rather on explaining to humans what we want the computer to do.

- Donald E. Knuth, Literate Programming, 1984

### Background

Reproducible research

Literate programming

Dynamic (repeated) reports

(Tutorials)

#### markdown

simple markup language

alternative to HTML (and LaTeX)

developed further by R-studio (see coursepage)

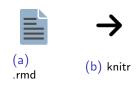

Add R to markdown

Add R to markdown

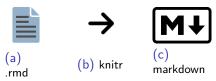

.rmd

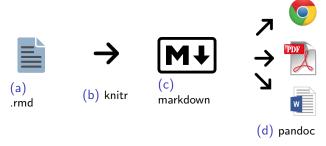

#### Add R to markdown

#### Add R to markdown

#### Add R to markdown

### ggplot2

popular visualization package

"The grammar of graphics"

- the language of visualization

flexible

ggplot examples

### the grammar

Create a graph layer by layer

Store as object (print to plot)

Three (main) parts:

data The data to visualize (data.frame)
geom The geometric representation of data
aes The mapping of colors/shape to data

#### geom

aes

y size color shape

# Special aes

geom Special aes

geom\_point point shape, point size

geom\_line line type, line size

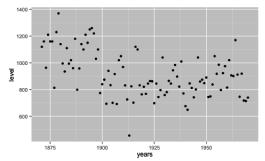

geom\_bar y min, y max, fill color, outline color

### GGPlot2: Example

```
library(ggplot2)

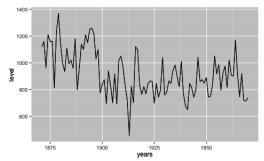

# Preprocessing
data(Nile)
Nile <- as.data.frame(Nile)
colnames(Nile) <- "level"
Nile$years <- 1871:1970
Nile$period <- "-_1900"
Nile$period[Nile$years >= 1900] <- "1900_-_1900]
Nile$period[Nile$years > 1945] <- "1945_+"
Nile$period <- as.factor(Nile$period)</pre>
```

# GGPlot2: geom\_point

STIMA LiU

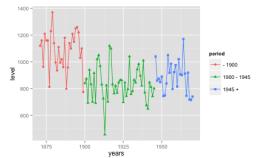

### GGPlot2: geom\_line

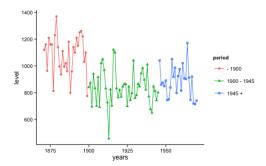

### GGPlot2: geom\_point + geom\_line + colors!

```
ggplot(data=Nile) +
    aes(x=years, y=level, color=period) +
    geom_line(aes(type=period)) +
    geom_point(aes(shape=period))
```

pl

### GGPlot2: use BW theme

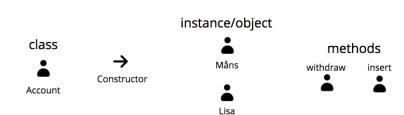

### Object orientation

Programming paradigm

Mutable states

Key abstraction is "an object"

R is not purely object oriented

#### **Fields**

currency (12/24) : class variable current\_amount : object variable no\_withdraws : object variable

#### Methods

insert()
withdraw()

### Inheritance

Savings

methods from

Account

STIMA LiU

# Object orientation in R

S3

Simple

Methods belongs to functions

		Fields and meth-
		ods \$

**S**3

```
# Create object
x <- 1:100
class(x) <- "my_numeric"</pre>
```

**S**3

```
# Create object
x <- 1:100
class(x) <- "my_numeric"
# Create generic function
f <- function(x) UseMethod("f")</pre>
```

### RC

```
# Create object with fields and methods
Account <- setRefClass("Account",
        fields = list(balance = "numeric"),
        methods = list(
                withdraw = function(x) {
                         balance <<- balance - x
                },
                deposit = function(x) {
                         balance <<- balance + x
object$copy()
```

The End... for today.
